

ATS & Generator Control Series

E24™

P263E

Automatic Transfer Switch Panels (ATS) are mainly electrical switches that switch the load between two sources. It is used when the client has a backup diesel generator and wants to integrate it with E24's Energy Storage System (ESS). ATSS supplies the input of the ESS and switches it between utility and diesel generator.

ATSS also controls the operation of diesel generators and provides protection functionalities both on inputs and output.

E24™

Applications

The ATS is used to provide the Energy Storage Solution with a two-sources input. It switches the system's input between utility when available and backup generator when needed.

ATSs also provide input/output overload protection, input/output short circuit protection, input/output disconnects, input phase loss protection, input phase reversal protection, input phase unbalance protection, input sources voltage drop/increase monitoring.

Unmatched Features

Overload Protection

The ATS is equipped with circuit breakers that trips once overloads occur.

Short Circuit Protection

The ATS is equipped with circuit breakers that trips once short circuits occur.

Phase Reversal/Loss/Unbalance & Low/High Voltage Protection

The ATS contains input phase relays that continuously monitors input phases and voltages and sends a signal to the main Programmable Logic Controller (PLC) that cuts off the corresponding input if phase errors or voltage errors occur.

Generator Control

The ATS controls the generator's operation and ensures that the generator is properly warmed up before supplying electricity and properly cooled after it is requested to turn off.

Standards

The ATS Series complies to the following IEC Standards:
IEC 60204-1, IEC 61439-1,2, IEC 61000-4-2, IEC 61000-4-3,
IEC 61000-4-4, IEC 61000-4-5, UL 1008

Operation

The Automatic Transfer Switch Panel (ATS) is used to provide the Energy Storage Control and Bypass Panel (ESCB) with a two-sources input. It switch the system's input between utility when available and backup generator when needed as per the below Single Line Diagram.

The ATS has three operation modes (AUTO, Manual, and OFF) that can be interchanged by the selector switch located at the front of the panel. In the "AUTO" mode, the ATS turns ON/OFF the generator as per the signal recieved from the ESCB and switches its output between utility and generator. In the "Manual" mode, the ATS turns ON the generator whenever utility is not available and switches its output between utility and generator. In both "AUTO" and "Manual" modes the ATS makes sure that the generator warms up and cools down according to manufacturer's specifications. In the "OFF" mode, the generator control functionality is disabled and the ATS only allows utility to supply its output.

If the ATS detects a phase reversal, phase loss, phase unbalance, low voltage, or high voltage on one of the two inputs it will automatically cuts off the corresponding input and send an alarm via RS485 Modbus RTU protocol to a optional BMS or to an optional exiting E24 Energy Storage System.
